

CIRO five-layer system architecture

Five systems turn citizen evidence into governed emergency action.

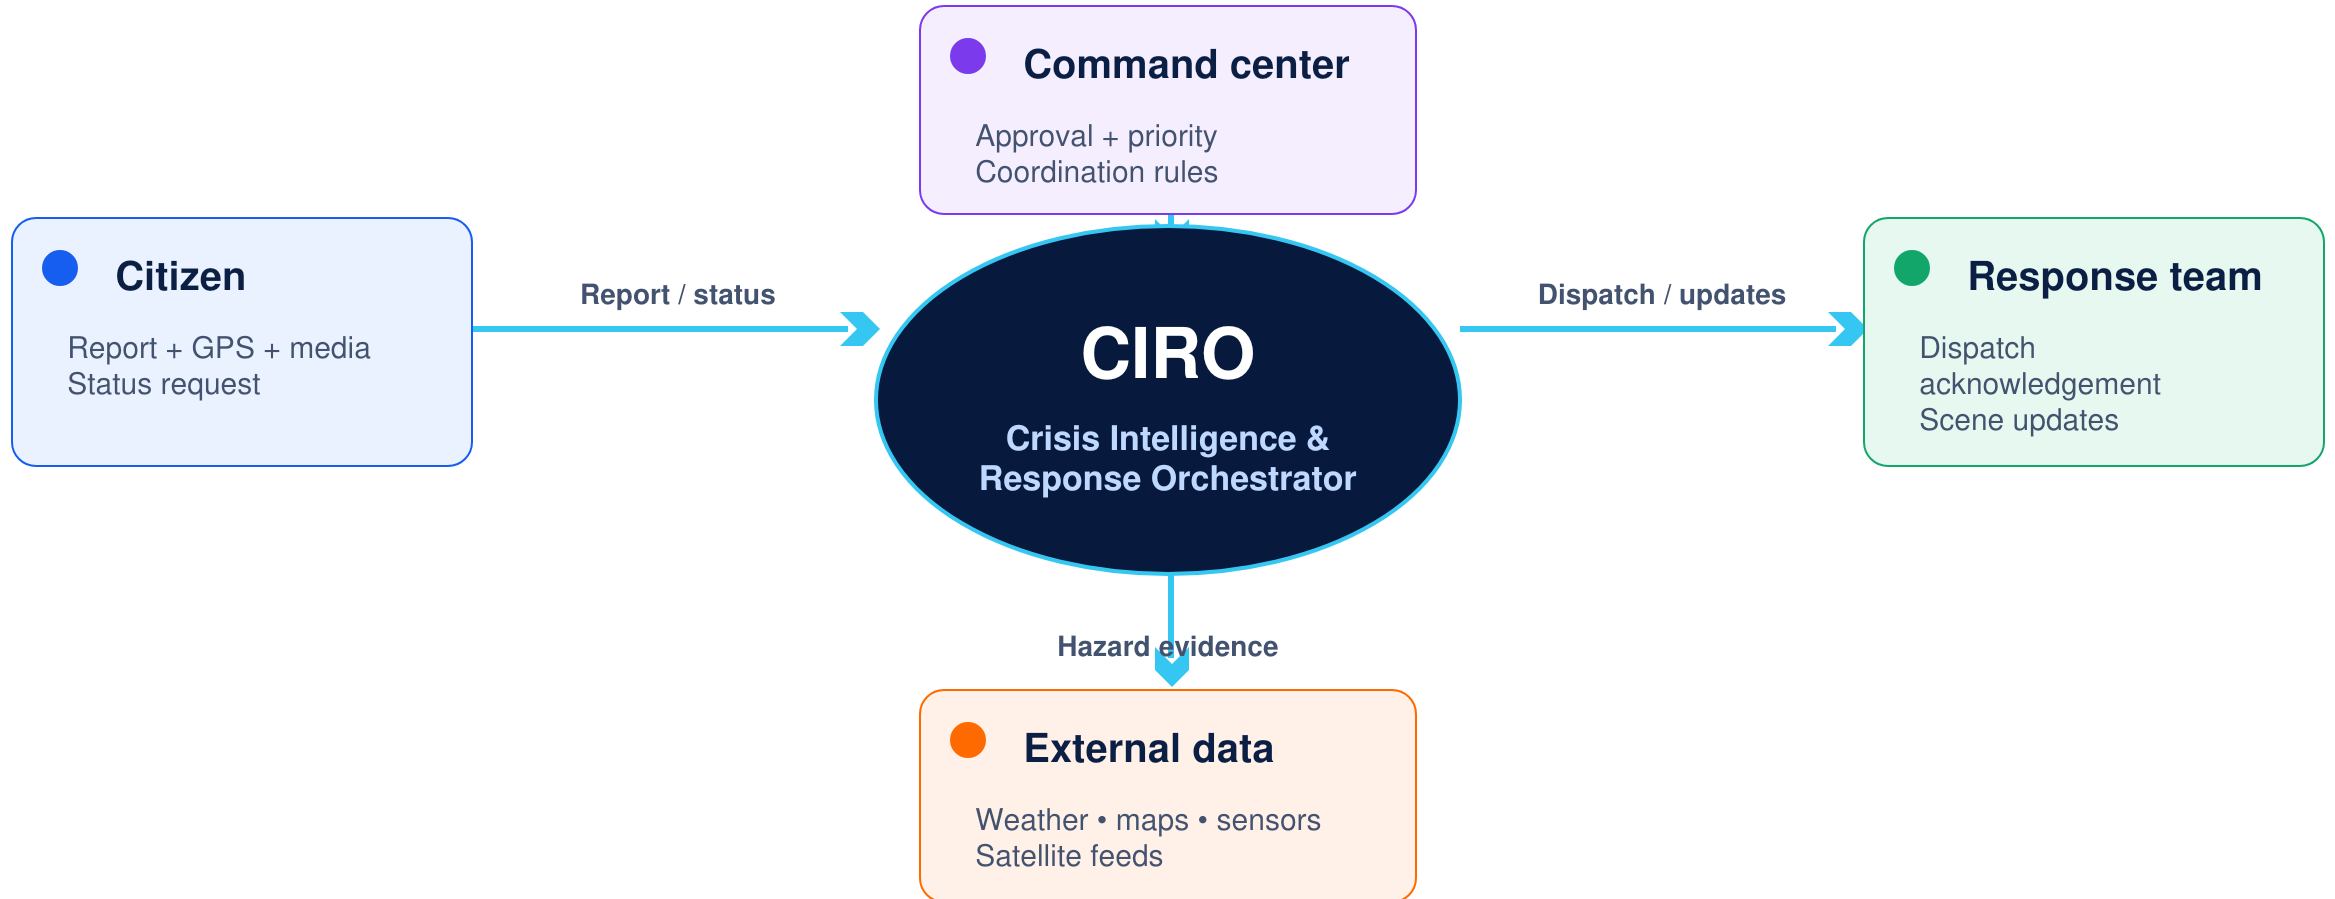

PRD map: what the product must achieve

The product requirements connect users, outcomes, capabilities, safeguards and measurement.

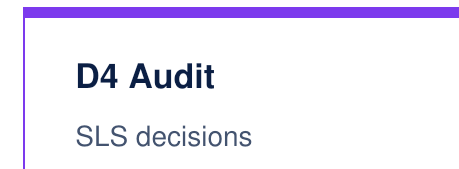

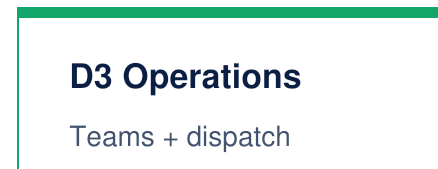

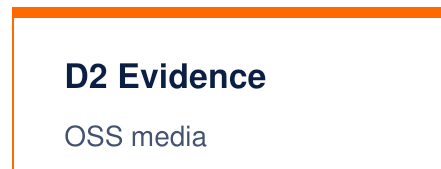

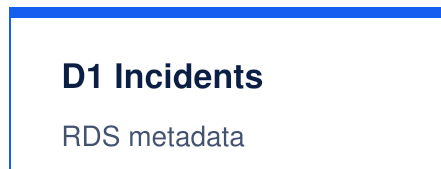

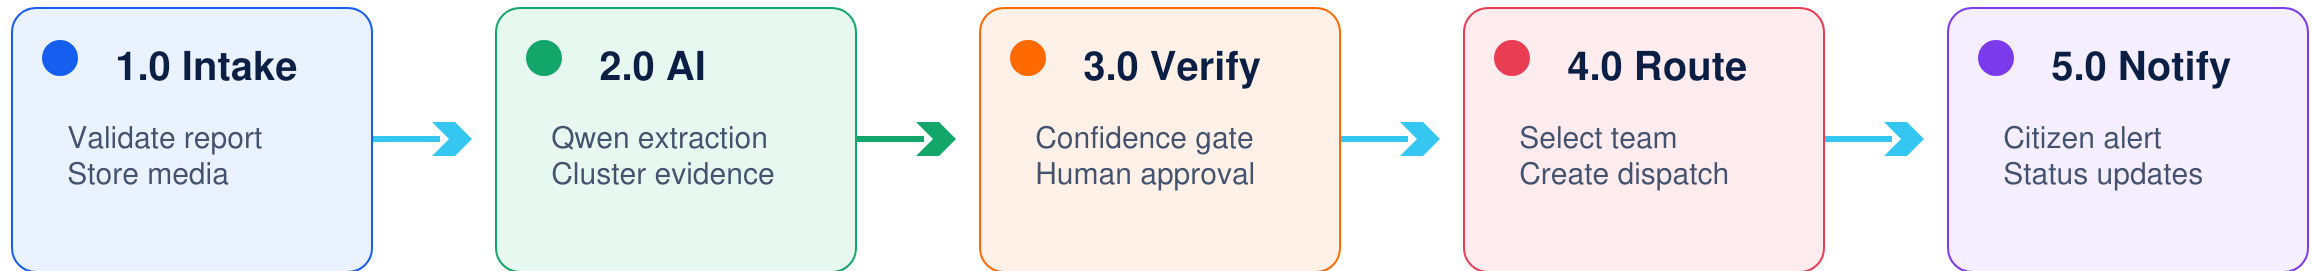

DFD Level 0: CIRO system context

External actors exchange only the data required for their role.

DFD Level 1: verified incident processing

The system separates intake, intelligence, authorization, response and audit.

Every model output, approval, override, dispatch and notification becomes a timeline event.

ERD: core operational data model

Incidents remain the center of evidence, decisions, dispatches and notifications.
